                                                                                                              The invention relates to isolated lung tumour-specific proteins and their corresponding cDNA molecules. Lung tumour-specific proteins and their antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonucleotide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is human T cell epitope related to lung tumour-specific protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        train LH59;

exopolysaccharides (EPS). These enzymes are designated EPS1-EPS11. and are encoded by open reading frames eps1-eps11. The enzymes are isolated from Lactobacillus helveticus strain LH59. The proteins are used in a method for the synthesis of EPS, which includes at least one step of forming a bond (alpha or beta-isomer) between C-1 (carrying the reducing aldehyde function, of an activated D-galactose pyranose), and a phosphate on a lipophilic or proteinaceous primer. Stepwise synthesis of EPS occurs with, in each step, addition of a new sugar unit, through its hemi-acetyl function, to an alcoholic hydroxyl of a second sugar unit, present at the end of a chain of sugar residues bonded to the primer. EPS1 has homology with an undecaprenyl-phosphate-glycosyl-1-phosphate-transferase; EPS2, EPS3 and EPS6 have homology with a beta-phosphate-transferase; EPS7 has homlogy with an EPS polymerase; EPS8 and EPS6 have homology with a beta-glycosyltransferase; EPS7 has homlogy with an EPS polymerase; EPS8 is a glycosyltransferase; EPS9 catalyses the transfer of phosphofuranose onto the following repetitive unit; EPS10 transferot of formed or not the EPS111 is involved in the synthesis and export of formed polysaccharides. The EPS enzyme are used to improve properties of foods, particularly fermented milk products such as yoghurt and cheese, e.g. their organoleptic properties and flavour stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of exopolysaccharides having

Mray polynucleotides and proteins are useful for diagnosing susceptibility to diseases by detecting mutations or polymorphisms in the mray gene or analysing for the presence of amount of mray protein expressed in a
             Lactobacillus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     otitis media;
endocarditis;
                       helveticus LH59. The operon contains 11 open reading frames, and encodes enzymes (eps1. eps2, eps3, eps4, eps5, eps6, eps7, eps8, eps9 and eps11) that are involved in the biosynthesis of exopolysaccharides (EPS). The enzymes catalyse the formation of specific intersugar bonds. The enzymes catalyse a process that includes at least one step of forming a bond (in alpha or beta anomeric form) between C1, carrying the reducing aldehyde group of an activated D-Galp (galactose in pyranose form), and a phosphate group on a lipophilic or proteinaceous primer. The enzymes are used to produce EPS that have antitumor or probiotic properties or are used in foodstuffs to improve organoleptic qualities and flavour. When expressed by lactic acid bacteria, EPS impart a free-flowing character and/or a smooth, creamy texture to acidified milk products (yoghurt or cheese).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 neumonia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Phospho-N-acetylmuramoyl-pentapeptide-transferase (mraY) polypeptide and polynucleotide - useful as diagnostic reagents for prevention and treatment of Streptococcus pneumoniae infections, which cause otitis media and meningitis
                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

patient sample. Mray PCR probes are useful for diagnosing diseases, and can characterise the response of the infectious organism to drugs. Mray proteins and polynucleotides are also useful for screening for antagonists, agonists and drugs against infectious micro-organisms. Mray agonists and antagonists are bacteriostatic and bacteriocidal compounds which can be used in treatment to enhance (agonist) or block (antagonist or antisense sequence) mray activity, therefore treating microbial diseases, especially Streptococcus pneumoniae diseases including otitis media, bacteraemia, conjunctivitis, pneumonia, sinusitis, pleural empyema, endocarditis and especially meningitis. Epitopes of mray proteins and polynucleotides are useful immunogens (vaccines) for producing anti-mray antibodies for prevention of bacterial infections, and mray polynucleotides can be used in genetic immunisation (gene therapy) to prevent infections. Mray proteins, polynucleotides and their (ant)agonists can prevent adhesion of bacteria to matrix proteins, and are useful for use on wounds and body implants to prevent bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Streptococcus pneumoniae; mraY; transferase; infection; pneumonia; phospho-N-acetylmuramoyl-pentapeptide-transferase family; otitis media; bacteraemia; conjunctivitis; sinusitis; pleural empyema; endocarditis; meningitis; gene therapy.

proteins are useful for diagnosing susceptibility to diseases by detecting mutations or polymorphisms in the mray gene or analysing for the presence of amount of mray protein expressed in a patient sample.

Mray PCR probes are useful for diagnosing diseases, and can characterise the response of the infectious organism to drugs. Mray proteins and polymucleotides are also useful for screening for antagonists, agonists and antagonists are bacteriostatic and bacteriocidal compounds which can be used in treatment to enhance (agonist) or block (antagonist or antisense sequence) mray activity, therefore treating microbial diseases, especially Streptococcus pneumoniae diseases including otitis media, bacteraemia, conjunctivitis, pneumonia, sinusitis, pleural empyema, endocarditis and especially meningitis. Epitopes of mray proteins and polynucleotides are useful immunogens (vaccines) for producing anti-mray antibodies for prevention of bacterial infections, and mray proteins, may proteins. Mray proteins, polynucleotides and their (antibodists can prevent adhesion of bacterial to matrix proteins, and are useful for use on wounds and body implants to prevent bacterial

Expression", where CEG stands for "Conserved Essential Gene". The nucleic acids are useful for detecting the presence of proteins essential for the viability of a bacterial cell wall in samples such as cells, tissues, biological fluids, blood, serum, nose, ear or throat swabs with ligands, and for detecting corresponding target nucleic acid molecules with complementary sequences. The nucleic acids are also useful for determining whether a genomic nucleotide sequence of interest is essential for viability of a bacterial cell or whether it resides within an open reading frame of the genomic sequence of interest comprising 200-500 base pairs) into the genomic sequence of interest comprising 200-500 base pairs) into the genomic sequence of interest which confers a selection agent such as chloramphenicol. The nucleic acids and proteins are also useful as vaccines and for treating bacterial infections with gene therapy and antisense therapy. The nucleic acids also enable identification of targets suitable for the treatment of antibiotic resistant bacterial infections.

(HUMA-) HUMAN GENOME SCI INC.

SM; Ruben Barash SC, Rosen CA,

01-483426/52. AAK56861. 2001 N-PSDB; WPI;

acids encoding human immune/hematopoietic antigen polypeptides, or preventing, diagnosing and/or treating cancers and for preventing, metastasis Nucleic useful

+ Sequence Listing; English 11673; 3071pp Claim 11; SEQ ID NO

amino acid sequences given in AAM82170 to AAM91921. (1) have cytostatic antino acid sequences given in AAM82170 to AAM91921. (1) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic actived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK84950 and AAM82169 crepresent sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the present

This sequence represents the VH5 domain of an anti-CD4 antibody

(Ab). This sequence can be used in the method of the invention for

treating a subject, where the treatment comprises administration of an

Ab. The method comprises the administration of an antibody which has an

old World monkey (e.g. baboon or macaque) variable region which binds to

method is useful for the treatment of eczema and immuno-modulated

diseases and especially rheumatoid arthritis. The recombinant antibodies

cused are sufficiently different from native monkey antibodies to allow

human antigens to raise these antibodies, but similar enough to human

compared to antibodies used in therapy in prior art, these antibodies do

not induce human anti-antibodies on repeated administration. They also

have longer half-lives and do not have a lack of effector function with
                                                                                                                                           variable heavy domain;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               useful for treating a disease or condition mediated by human proteases. The present sequence is a rat GPCR polypeptide used in comparison studies with the polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the sequence
GPCR
                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated human G protein-coupled receptor (GPCR) polypeptide that is related to the MAS proto-oncogene receptor subfamily. The polypeptide comprises a fully defined sequence of 289 amino acids as given in the specification, or its fragment comprising 10 contiguous amino acids, or an amino acid sequence of an allelic variant or orthologue of the amino acid sequence given in the sequence polypeptide is useful for identifying a modulator of a GPCR useful for treating a disease or condition it. The polypeptide is also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
proteins AAR48685-R48758 represent a range of G-protein coupled receptor proteins selected from cAMP, adenosine, muscarinic acetylcholine, adrenergic, thrombin, endothelin, bombesin, endocrine, rhodopsin, opsin, odorant, cytomegaloviral and other G-protein coupled receptors. The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see AAR48759-R48758, AAR50569-R50807 and AAR89189-R89195 for examples of polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder such as schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      G-protein coupled receptor; ligand binding assay; transmembrane domain; schizophrenia; dopamine; cAMP; adenosine; thrombin; adrenergic; opsin; muscarinic acetylcholine; endothelin; bombesin; endocrine; rhodopsin; odorant; cytomegalovirus; serotonergic.

Proteins AAW02657-W02730 represent a range of G-protein coupled receptor (GPR) proteins selected from CAMP, adenosine, muscarinic acetylcholine, adrenergic, thrombin, endothelin, bombesin, endocrine, rhodopsin, opsin, odorant, cytomegaloviral and other GPR proteins. The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see AAW02747-W02999 for examples of polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder such as schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                e; dementia;

protein, IGPCR18 (1). (1), the polynuclectide (II), agonists and antagonists of (1)/(II) are useful for the diagnosis and treatment of cardiovascular system disorders, the detection of mutant or inappropriately expressed forms of IGPCR18, and for drug screening. (I) is useful in treatment of diseases associated with signal processing in female reproductive tissues, such as infertility, cardiovascular diseases such as coronary heart disease, heart attack and stroke, inflammatory disorders and metabolic disorders linked to reproductive tissues like uterus, placenta, ovary and prostate, reproductive disorders, pain, cancer, central nervous system disorders such as schizophrenia, episodic paroxysmal anxiety (EPA) disorders such as schizophrenia, episodic paroxysmal anxiety (EPA) disorders such as schizophrenia, disorder (ICDD), Parkinson's disease, moltility disorders such as renal failure, obesity, gastrointestinal cisorders such as tritable bowel syndrome (IBS), diarrhoea, motility disorders such as bacterial, fungal, protozoal and viral infections, asthma, allergy, arthritis, and sepsis. (I) is useful for the products involved in regulating IGPCR18, and as pharmaceutical reagents. (II) is useful for mapping the location of the gene to the chromosome, and to detect abnormalities involving IGPCR18 gene structure. This is the amino acid sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  virus; HIV; arthritis;

peripheral vascular disease, Raymand's disease, kidney disease, dyslipidaemias, obesity, emesis, gastrointestinal disorders including irritable bowel syndrome, inflammatory bowel disease, diabetic gastroparesis and diabetes, ulcers, diarrhoea, osteoporosis, inflammations, infections including bacterial, fungal, protozoan and viral infections, pain, cancers, chemotherapy induced injury, tumour invasion, immune disorders, urinary retention, asthma, allergies, arthritis, benign prostatic hypertrophy, endotoxin shock, sepsis, complications of diabetes mellitus, and gynaecological disorders. The polypeptide and polynucleotide of the invention are also useful so research reagents and materials for discovery of treatments and diagnostics to animal and human diseases. The polypeptide is also useful for chromosome identification. The polypeptide is also useful for assessing the binding of small molecule substrates and ligands in cells, cell-free preparations, chemical libraries and natural product mixtures. The present sequence is human IGS43 GPCR.
                                                                                                                                                                                                                                                                                                                                                             The invention relates to IGS43 G-protein coupled receptor (GPCR) and the polynucleotide encoding it. The IGS43 polypeptide, polynucleotide, egonist, antagonist or antibody is useful for treating dysfunctions or disorders related to uterus, kidney, lung, trachea, colon, small intestine, stomach, mammary gland, prostate, testis, central nervous cystem, cerebellum and spinal cord. The polypeptide is useful as vacine for inducing immunological response in a mammal, for treating cysthiatric and central nervous system disorders including conjulsive disorder, post traumatic disorder, phobia and panic, major depressive disorder, bipolar disorder, parkinson's disease, general anxiety disorder, autism, delirium, multiple sclerosis, Alzheimer's disease, dementia, severe mental retardation, Huntington's disease, disease, dementia, stroke, addiction/dependency/craving, sleep canciovascular diseases including heart failure, angina pectoris, arrhythmias, myocardial infarction, cardiac hypertrophy, hypotension, hypertension, thrombosis, arteriosclerosis, cerebral infarction, cardiac hypertrophy, hypotension, constructs and including permandial including correbral infarction, cardiac hypertrophy, hypotension, hypertension, thrombosis, arteriosclerosis, cerebral infarction, cardiac hypertrophy, disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              eful as vaccine

DE G protein coupled receptor protein.
```

```
G protein coupled receptor (GCR) proteins can be used to identify ligands which act as antagonists of GCR/ligand binding. Such ligands can be used for promoting or inhibiting physiological responses such as liberation of arachidonic acid, acetylcholine and endocellular calcium, endocellular cyclic AMP production, production of inositol, changes in cell membrane potential, phosphorylation of endocellular proteins, activation of c-fos, lowering of pH, activation of G protein and cell promulgation. The GCR products can also be used for the detection of ligands and in the production of antibodies and

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Sucrose synthase of Arabidopsis: genomic cloning and sequence characterization.";
Plant Mol. Biol. 18:131-134(1992).
-!- FUNCTION: SUCROSE-CLEAVING ENZYME THAT PROVIDES UDP-GLUCOSE AND FRUCTOSE FOR VARIOUS METABOLIC PATHWAYS.
-!- CATALYTIC ACTIVITY: UDP-glucose + D-fructose = UDP + sucrose.
-!- INDUCTION: BY ANAEROBIC STRESS.
-!- INDUCTION: BY ANAEROBIC STRESS.
-!- SIMILARITY: BELONGS TO THE GLYCOSYLTRANSFERASE FAMILY 1. PLANT SUCROSE SYNTHASE SUBFAMILY.
